

Canterbury University seal their future

Canterbury university have built a new multi level accommodation block as part of the growth plans for the future.

And of course the main contractor chose Wykamol Registered installer Advance Property preservation to carry out the waterproofing works in the large basement areas.

Wykamol alongside Simon Wooton of Advance property designed the scheme to incorporate 2 forms of waterproofing to conform to BS8102.

In this project Wykamol cement based crystalline slurry was used as a Type A system alongside our Cavity drain membranes. Both these systems carry the BBA accreditation for the architects and engineers on site.

Working on projects like these enables us to showcase the benefit of working alongside us, with site supervision a full design service from looking at plans to site visits to check on the construction progress and sign off of the waterproofing towards the end of the project.

Make sure that you contact us if you have a project and not forgetting having contractors who are registered across the UK also gives us the ability to look at projects from Lands End to John O'Groats.

The project will also have a fully insured back up guarantee from the contractor alongside our own long term product warranty system.

Make sure you contact the team at Wykamol to help on your next project on 0845 400 6666
