

## East London new hotel gets Wykamol seal of approval

### A new build London hotel in the bustling shoreditch area of London gets the basement BS8102 treatment

A new build London Hotel in the bustling Shoreditch area of London gets the basement BS8102 treatment, Cavity drain membranes and waterproof concrete have been used to form part of a BS8102 designed scheme .

Wykamol was asked to attend the site to help design a scheme to waterproof this new build space which was going to form part of the new hotel for a restaurant and office areas.

Having looked at the scheme Wykamol was able to send over a design scheme, as well as 3D specialist drawings to the Wykamol, registered installer Advance Property Preservation.

Managing director Simon Wooton asked Wykamol to help so our BBA-approved products would be passed by the engineers and architects, working at the design stage Wykamol are able to help look at the plans and to help to create a robust basement waterproofing scheme.

When dealing with water from the ground care must be taken to ensure dual waterproofing schemes can work together to give the clients a dry space that can be used without any difficulty of damage to the system

In this instance, our Type C cavity drain membranes including our high visibility yellow membranes were used, these membranes not only act as a waterproofing product but are also passed as a ground gas membrane against Radon
